

Brown rice benefits

Selvakumar K

We usually look for antioxidants from green leaves to prevent ourselves from cancer and other health risks. We can also extend our interest in cereals for this purpose. Along with antioxidants, certain minerals, such as selenium can also reduce the chances of developing certain forms of cancer and heart problems. Fortunately, we have food that contains both antioxidants and selenium, and that food is brown rice. Apart from these antioxidants and trace minerals, brown rice is also rich in manganese, fibres, naturally occurring oils, etc. and forms the best diet for our body. With high fibre content, brown rice helps to keep the bowel movement working fine and also increases our metabolism; hence, it forms the best food for weight reduction and weight management. The glycaemic index of brown rice is lower than white rice and is more suitable for patients who suffer from diabetes. Try including brown rice in your diet, and make the best use of it.

Keywords: Brown rice, Health, Diet food, Antioxidants, Minerals, Weight reduction
